

**National Emergency Medical Services Advisory Council**

**DRAFT/INTERIM/FINAL**

**Advisory and Recommendations**

**Title: Mitigating Medication, Supply, and Device Shortages.**

As prepared by the Subcommittee on **Equitable Patient Care**

**A. Executive Summary**

The National Emergency Services Advisory Council (NEMSAC) recognizes that Emergency Medical Services (EMS) clinicians must have equitable access to medications, medical supplies, and medical devices in order to protect the health and safety of the public. Unfortunately, many of the most critical medications, supplies, and devices are often in critically short supply for many reasons, including:

**Healthcare Economic Pressures**

Contrary to recent public debates on the high prices of medications, the majority of medications used by EMS are generic and, therefore, may not be commercially attractive for manufacturers. However, manufacturers must satisfy rigorous regulatory requirements that assure all products are safe to use. Given these constraints, there is no surprise that a limited number of companies devote limited resources (manufacturing sites, warehouses, production lines, etc.) to these medications, supplies, and devices.

**Vulnerable Supply**

These economic pressures create a vulnerable supply chain without excess capacity to mitigate the impact of disruptions. In the aftermath of Hurricane Maria (2017), common intravenous infusions were in critical shortage because a plant in Puerto Rico that manufactures the sterile bags that are filled with the infusions was heavily damaged. Similarly, a 2023 tornado in Rocky Mount, North Carolina damaged a pharmaceutical production site responsible for sterile injectable medications, and the largest manufacturer of intravenous solutions closed its Marion, North Carolina facility in the aftermath of

31 Hurricane Helene (2024). Due to the lack of redundancy in production facilities, isolated  
32 events result in the need for rationing of critical medications, supplies, and devices.

33 **Unknown Demand, Preparedness, and Waste**

34 While routine EMS patient care volumes can be somewhat stable over time, EMS must also  
35 be prepared to meet surging demand with little/no notice, for any type of response, for any  
36 length of time. A mass shooting may require significant hemorrhage control supplies in an  
37 isolated area, a chemical release may require mass treatment with seldom-used antidotes,  
38 and a global pandemic requires a seemingly infinite supply of personal protective  
39 equipment. To meet both known and unknown demand, EMS agencies frequently  
40 overstock medications, supplies, and devices in order to be prepared. Unfortunately, the  
41 cost of preparedness often translates into waste when medications, supplies, and devices  
42 expire or exceed shelf life.

43 **Impact on All Aspects of Emergency Care**

44 While critical shortages of medications are highly publicized, all aspects of emergency care  
45 are impacted. EMS agencies have faced difficulty in obtaining medical devices (ex:  
46 automated external defibrillators), supplies (ex: sterile saline flush, defibrillator batteries  
47 and pads), and emergency vehicles. Devices, supplies, and vehicles are just as critical as  
48 medications, and all are subject to economic pressures, supply chain vulnerabilities, and  
49 unknown demand.

50 **Need for EMS-Tailored Solutions**

51 EMS is not funded in the same manner as the rest of healthcare, with some of the most  
52 resource-intensive responses receiving no reimbursement (ex: cardiac arrest resuscitation  
53 attempts without transport to the hospital). Strategies that may be feasible in a hospital or  
54 outpatient setting, such as development of a buffer stock or incentives that raise the cost of  
55 medications, will likely exacerbate the fragile economics of prehospital care.

56 **Need for EMS Representation**

57 The COVID-19 pandemic response highlighted many shortcomings in obtaining and  
58 maintaining adequate quantities of critical medications, medical devices, and medical  
59 supplies. Several Presidential Orders and Cabinet-level reports and policy suggestions  
60 attempt to address the issues. Hospitals and outpatient settings are frequently included, but

61 the voice and lens of EMS is frequently absent. Without representation, the unique  
62 challenges faced by EMS are unlikely to be addressed.

63  
64 Increased attention to the crisis of medication, supply, and device shortages may be a silver-lining  
65 of the COVID-19 pandemic. Several opportunities to guarantee that EMS has access to these  
66 critical items have arisen, including:

- 67 • Improved understanding of demand, to assure that future supplies are adequate
- 68 • Improved visibility of pending shortages, to give enough time to update clinical protocols  
69 and educate EMS clinicians on necessary changes
- 70 • Improved understanding of the unique challenges faced by EMS, so that solutions for other  
71 aspects of the healthcare system do not paradoxically negatively impact prehospital care  
72 and operations

73  
74 **B. Recommendations**

75 **National Emergency Medical Services Advisory Council**

76 Council recommendations to itself.

77

78 **National Highway Traffic Safety Administration**

79 **Recommendation 1:** Using the National Emergency Medical Services Information System  
80 (NEMSIS) to quantify actual medication usage, National Highway Traffic Safety  
81 Administration (NHTSA) should collaborate with the Federal Drug Administration (FDA) to  
82 create a dashboard of critical medications in order to detect signals of increased use that may  
83 translate to shortages. The dashboard must be available to EMS agencies (to plan mitigation  
84 strategies) and manufacturers (to inform production).

85 **Recommendation 2:** NHTSA should work with the National Emergency Medical Services  
86 Information System Technical Assistance Center (NEMSIS TAC) and the National  
87 Association of State EMS Officials (NASEMSO) to encourage state offices of EMS to create  
88 dashboards available to individual EMS agencies capable of tracking actual medication usage  
89 to avoid inadvertent overstocking and waste.

120 medication practices (ex: 5 Rights of Medication Administration) to minimize risks  
121 associated with medication substitutions due to shortages.

122

123 **C. Scope and Definition**

124 EMS and the 9-1-1 system exist to provide timely, life-saving, and compassionate care outside  
125 of the hospital. Several time critical emergencies require immediate evaluation and treatment to  
126 maximize survival; delays in hemorrhage control after trauma, benzodiazepine administration for  
127 status epilepticus, epinephrine administration for anaphylaxis, and defibrillation for out of  
128 hospital cardiac arrest contribute to otherwise preventable death and disability. Even when lives  
129 are not at stake, delays in pain management are inhumane. Common sense dictates that EMS  
130 clinicians must have the appropriate medications, devices, and supplies to treat these time-  
131 sensitive conditions.

132

133 Clinical protocols, established at the state or local level, provide specific treatment guidance for  
134 care, and changing protocols is a time-consuming and administratively challenging process.  
135 Each EMS practitioner must be trained on any changes before protocol implementation, and this  
136 educational burden further delays implementation of any new or modified treatment  
137 recommendation. State pharmacy board policies vary, but many EMS agencies must obtain and  
138 maintain Terminal Distributor of Dangerous Drugs licenses that specifically list the name and  
139 concentration of medications available for administration as part of prehospital care; separate  
140 DEA licensure is needed for controlled substances. These licenses must be updated with any  
141 changes in clinical protocols before implementation.

142

143 Unfortunately, medication shortages are common, widespread, and long-lasting; all levels of  
144 prehospital care in every state, territory, and tribal region have been impacted for more than a  
145 decade. Multiple factors contribute to this ongoing crisis, including limited manufacturing, lack  
146 of financial incentives, and disruption of vulnerable supply chains by natural disasters and  
147 workforce issues. In 2023, the FDA reported 53 *new* and 98 *ongoing* medication shortages  
148 (FDA, Drug Shortages CY 2023, 2023). Medical device shortages have largely resolved,  
149 although the FDA Office of Supply Chain Resilience notes pertinent discontinuations, including

150 automated external defibrillators and personal protective equipment components (FDA, Medical  
151 Device Shortages List, n.d.).

152

153 **D. Analysis**

154

155 Issued in August 2020, Presidential Executive Order “Combating Public Health Emergencies and  
156 Strengthening National Security by Ensuring Essential Medicines, Medical Countermeasures,  
157 and Critical Inputs Are Made in the United States” calls for creating a list of essential  
158 medications and medical countermeasures, accelerating domestic production of those essential  
159 medications and medical countermeasures, and identifying vulnerabilities in supply chains  
160 (Trump, 2020). The FDA used several criteria in creating the list of essential medications and  
161 medical countermeasures, including medications for treating or stabilizing acute life-threatening  
162 conditions and devices that are always medically necessary to have in adequate supply (FDA,  
163 Criteria For Identifying Human Drug and Biologic Essential Medicines, Medical  
164 Countermeasures, and Critical Inputs for the List Described in Section 3(c) of the Executive  
165 Order (EO) 13944 , 2020). More than 300 medications and devices appear in the subsequent list  
166 (FDA, Drug and Biologic Essential Medicines, Medical Countermeasures, and Critical Inputs for  
167 the List Described in Section 3(c) of the Executive Order 13944, 2020).

168

169 Subsequent Presidential Executive Orders, issued January and February 2021, directed HHS  
170 ASPR, FDA, and other federal agencies to review and report on supply chain issues (Biden,  
171 Executive Order 14017 America's Supply Chains, 2021) (Biden, A Sustainable Public Health  
172 Supply Chain, 2021). The Departments of Defense, Health and Human Services, Homeland  
173 Security, and Veterans Affairs collaborated to create the National Strategy for a Resilient Supply  
174 Chain (Multiple, 2021). ASPR conducted interviews, surveys, workshops, desktop research, and  
175 solicited public feedback to draft the “Essential Medicines Supply Chain and Manufacturing  
176 Resilience Assessment” (ASPR, Essential Medicines Fact Sheet) (ASPR, Essential Medicines  
177 Supply Chain and Manufacturing Resilience Assessment, 2022). The broader FDA list of  
178 essential medications was pared down to a priority list of 86; of those pertinent to prehospital  
179 care, only 10 were not considered to be in shortage status by ASHP and/or the FDA, and some

180 have been in shortage since 2009. Select solution strategies include:

- 181 • Improving supply chain visibility to anticipate, prioritize, and respond to critical issues,  
182 demands, and disruptions;
- 183 • Improving data and information sharing across the supply chain;
- 184 • Promoting a diversified approach to capacity that avoids single points of failure;
- 185 • Leveraging the federal government’s purchasing power;
- 186 • Regionalizing the Strategic National Stockpile for better positioning of essential  
187 medications;
- 188 • Proactively developing logistics plans for distribution of essential medications.

189

190 HHS released the white paper “Policy Considerations to Prevent Drug Shortages and Mitigate  
191 Supply Chain Vulnerabilities in the United States” that details administrative actions in response  
192 to the ongoing medication shortage crisis (HHS). These steps include:

- 193 • Creation of a new Supply Chain Resilience and Shortage Coordinator that works across  
194 HHS divisions;
- 195 • FDA’s response uses multiple information sources to determine if a shortage exists or is  
196 expected in order to plan mitigation strategies;
- 197 • ASPR’s creation of an essential medication list detailed above;
- 198 • A presidential memorandum allows HHS, under the Defense Production Act, to expand  
199 manufacturing capacity and flexibility and strengthen public-private partnerships
  - 200 ○ ASPR is exploring how this authorization can increase domestic production of  
201 essential medications
- 202 • CMS is considering processes to support hospital access to a buffer stock of essential  
203 medications.

204 Other proposed solutions include requiring drug manufacturers to notify the FDA of increasing  
205 demand or interruption or discontinuation of production and allowing ASPR to fund large-scale  
206 manufacturing of critical medications, either in The response to a specific event or to support  
207 stockpiling.

208

209 Many of these proposed solutions are not new. The FDA’s 2019 report “Drug Shortages: Root  
210 Causes and Potential Solutions” also recommended improved data sharing, requiring risk  
211 management plans for manufacturers, lengthened expiration dates of medications facing  
212 shortage, predictive modeling (recommended in a 2014 GAO report), and tracking of  
213 manufacturer inventories of essential medications (FDA, Report | Drug Shortages: Root Causes  
214 and Potential Solutions, 2019) (GAO, 2014). While these solutions have not been implemented,  
215 others have been, including improved FDA collaboration with HHS ASPR and DARPA, creation  
216 of a list of essential medications, and tracking of medical device shortages.

217  
218 The NEMSAC notes that the Department of Transportation, as the federal home of EMS, was  
219 largely absent in creating these assessments, strategies, and policy considerations.

220  
221 Recently, several professional organizations have called attention to the special circumstances  
222 faced by EMS. Ten stakeholder groups, including the NASEMSO, National Association of EMS  
223 Educators (NAEMSE), National Association of Emergency Medical Technicians (NAEMT), and  
224 the National Association of EMS Physicians (NAEMSP), sent a joint letter to the Senate Finance  
225 Committee highlighting aspects of the shortage crisis that are unique to EMS and that shortages  
226 in EMS must be prioritized and addressed differently. Specifically, scope of practice issues, the  
227 lack of economic leverage of small EMS agencies, and the lack of resources may limit the  
228 effectiveness of strategies suggested in the reports above (Appendix 1).

229  
230 NAEMT, the International Association of Fire Fighters (IAFF), the International Association of  
231 Fire Chiefs (IAFC), and the American Ambulance Association (AAA) highlight the challenges  
232 of acquiring new emergency vehicles due to supply chain issues. In a joint letter to the Secretary  
233 of Transportation sent August 2022, the groups note that the expected acquisition time for a new  
234 ambulance has ballooned from 2 months to an unacceptable 2 years (Appendix 2). There are  
235 similar delays in acquiring new fire apparatus, and the ability to respond to emergencies—  
236 including priorities in the National Roadway Safety Strategy—is challenged. In the letter,  
237 stakeholders point to decreased vehicles chassis production; the Department of Commerce  
238 (DOC) notes a “fragile” semiconductor supply chain with demand that “far outstrips supply,”

239 and this shortage likely exacerbates vehicle production problems (DOC, 2022). These issues are  
240 further detailed in the EMSWorld e-book “The Ambulance Shortage—Problems and Solutions”  
241 (EMSWorld). Contributors to the e-book received a statement from the Department of  
242 Transportation that the joint letter had been received and “we intend to convene relevant  
243 stakeholders in the industry to identify potential actions to address it.”  
244

#### 245 **E. Strategic Vision**

246 Ensure that EMS has reliable access to essential medications, medical devices, and medical  
247 supplies in order to fulfill the mission of improving health, reducing morbidity and mortality,  
248 and relieving suffering in the prehospital setting.  
249

#### 250 **F. Strategic Goals**

251 (1) Within one year, the Secretary of Transportation will request that EMS is specifically  
252 represented in all aspects related to the assessment of, or solutions to, shortages in  
253 medications, medical supplies, and medical devices.

254 (2) Within two years, NHTSA, through NEMSIS and relevant partners, will create dashboards  
255 to track actual usage of medications.

256 (3) Within two years, the Department of Transportation will convene stakeholder listening  
257 sessions regarding prolonged acquisition times for emergency vehicles.

#### 258 **G. Crosswalks**

259 Previous NEMSAC advisories relevant to this issue include:

- 260 ○ Implementing the National EMS Culture of Safety Strategy (2014)
- 261 ○ EMS Utilization of Controlled Substances (2017)
- 262 ○ EMS Resource Allocation and Distribution During Disaster (2021)
- 263 ○ Impact of Public Law 115-83 on EMS Providers: Protecting Patient Access to  
264 Emergency Medications Act of 2017 (2024)
- 265 ○ Biennial State of EMS Systems Funding (2023)
- 266
